In this grasshopper definition by creating and adjusting a parametric noise on a grid of points and then lofting them back you can model a kinetic like form. Subdivided Rectangles In this grasshopper definition by choosing a random point inside a rectangle and creating a loop which constantly cuts the rectangle from a point vertically and horizontally you can have a parametric subdivided model.

In this Parametric Architecture video we will take a look at the Schüco Parametric System and how it works. Then we will model the panels in Grasshopper by producing a base surface and then dividing the surface in to panels. We will also use a range of numbers combine by Graph mapper to produce a sine wave.

Parametric Building In this Parametric Building tutorial, I will teach you how to model a parametric facade in Grasshopper. First I will divide the surface into divisions and then convert the facade to mesh and use weaverbird to extrude the Mesh. finally, the point attractors will produce a parametric building.

Grasshopper is based on graphs (see Graph (discrete mathematics)) that map the flow of relations from parameters through user-defined functions (nodes), resulting in the generation of geometry. Changing parameters or geometry causes the changes to propagate throughout all functions, and the geometry to be redrawn.
